

Myanmar E-Commerce Sales Analytics Report

Data Analysis Portfolio Project · January – April 2026

Prepared by	Junior Data Analyst — Portfolio Submission
Dataset	Myanmar E-Commerce Sales — 150 cleaned transactions
Period	1 January 2026 – 30 April 2026 (4 months)
Tools used	Python (Pandas, Matplotlib) · Power BI Desktop · MySQL · ReportLab
Generated	17 May 2026

Contents

1	Executive Summary & Key KPIs	2
2	Revenue by Region / State	3
3	Product Category Analysis	4
4	Monthly Sales Trend	5
5	Sales Channel & Payment Method	6
6	Order Status Analysis	7
7	Data Cleaning Log	8
8	Key Findings & Recommendations	9

1. Executive Summary

High-level overview of Myanmar e-commerce sales performance — Jan to Apr 2026

This report analyses 150 cleaned transactional records from a mock Myanmar e-commerce platform spanning January to April 2026, covering five product categories, six sales channels, and six regional states. After rigorous data cleaning — resolving duplicates, outliers, text inconsistencies, and missing values — the dataset reveals a healthy but regionally concentrated business with strong digital payment adoption and an opportunity to expand into underserved regions.

Total Revenue	Total Orders	Avg Order Value	Delivery Rate
164M	149	1.1M	89.3%
MMK	transactions	MMK / order	of orders

Key highlights at a glance

- Yangon dominates with **54.5% of total revenue**, driven by higher order volumes and a more digitally active customer base.
- Electronics is the top revenue category at **52.4M MMK**, despite ranking second in order count — indicating a higher average unit price.
- March 2026 was the strongest month at **52.1M MMK**, a 74.8% jump from February, likely driven by seasonal demand or promotional activity.
- Viber Shop and Website together account for **75% of order volume**, making them the most critical sales channels to optimise.
- Digital payments (AYAPay, KBZPay, WaveMoney, CB Pay) collectively processed **79.2% of all orders**, reflecting Myanmar's rapid shift away from cash.

■ The data reveals a two-speed market: Yangon and Mandalay account for 71.9% of revenue combined, while Mon State, Shan State, Bago, and Naypyitaw collectively contribute only 28.1%. This geographic concentration represents both a risk and an expansion opportunity.

2. Revenue by Region / State

Total sales revenue breakdown across Myanmar's six regions in the dataset

Figure 2.1 — Percentage share of total revenue (164M MMK) by Region_State

Regional performance breakdown

Region / State	Revenue (MMK)	Share %	Estimated Orders
Yangon	89,450,000	54.5%	~81
Mandalay	28,600,000	17.4%	~26
Shan State	19,800,000	12.1%	~18
Mon State	14,200,000	8.7%	~18
Bago	8,900,000	5.4%	~9
Naypyitaw	3,050,000	1.9%	~2
TOTAL	164,000,000	100%	149

Regional Insight: Yangon alone accounts for more revenue than all other regions combined. However, Mon State and Shan State each have 18 orders — equal volume to each other — yet their combined revenue (34M MMK) is just 38% of Mandalay's (28.6M MMK suggests higher avg order value). Targeted promotions in Mon State and Shan State could significantly increase revenue without acquiring new customers.

3. Product Category Analysis

Revenue and order volume by product category — identifying high-value vs high-volume segments

Figure 3.1 — Revenue (MMK, navy) vs order count scaled (green) by product category

Category performance summary

Category	Revenue (MMK)	Orders	Avg Rev/Order	Rev Share
Electronics	52,400,000	38	1,378,947	31.9%
Fashion & Apparel	38,900,000	40	972,500	23.7%
Home & Groceries	24,600,000	36	683,333	15.0%
Cosmetics & Beauty	18,100,000	35	517,143	11.0%

Category Insight: Electronics generates the highest revenue per order (1,378,947 MMK avg) despite being second in order count. Fashion & Apparel leads in order volume (40 orders) but has a lower average order value — suggesting frequent, smaller purchases. A strategy of bundling complementary categories (e.g. Electronics + accessories) could lift overall average order value significantly.

4. Monthly Sales Trend

Revenue trajectory across four months — identifying growth patterns and seasonal signals

Figure 4.1 — Total monthly revenue in MMK across January to April 2026

Month-by-month breakdown

Month	Revenue (MMK)	vs Prior Month	Share of Total
January 2026	34,200,000	—	20.9%
February 2026	29,800,000	▼ -12.9%	18.2%
March 2026	52,100,000	▲ +74.8%	31.8%
April 2026	47,900,000	▼ -8.1%	29.2%
Total	164,000,000		100%

■ **Trend Insight:** The sharp 74.8% spike in March 2026 is the most significant signal in the dataset. This likely corresponds to a promotional campaign, public holiday shopping surge, or new product launch. Investigating what drove March's performance and replicating it in Q3/Q4 is the single highest-ROI action the business can take based on this data.

5. Sales Channel & Payment Method Analysis

Where customers buy and how they pay — critical for digital strategy

Orders by Sales Channel

Figure 5.1 — Order count distribution across five sales channels

Orders by Payment Method

Figure 5.2 — Order count by payment method; digital payments dominate at 79.2%

■ **Channel Insight:** Viber Shop (57 orders, 22.6%) and Website (56 orders, 22.2%) are the two dominant channels — yet they operate very differently. Website buyers tend to be more deliberate purchasers; Viber Shop buyers are social-commerce driven. TikTok Shop at 17.8% is growing and deserves dedicated content investment, especially for Fashion & Apparel and Cosmetics categories which perform well with video-first content formats.

■ **Payment Insight:** Only 18.1% of orders used Cash on Delivery (COD) — a strong indicator of customer trust in the platform and digital payment infrastructure. AYAPay leads at 24.2%, followed closely by KBZPay (23.5%). Offering exclusive discounts for digital payment users could further reduce COD dependency and improve cash flow predictability.

6. Order Status Analysis

Fulfilment quality — delivery, cancellation, and return rates

Order Status Distribution

Figure 6.1 — Order fulfilment outcome: 89.3% delivered, 7.4% cancelled, 3.4% returned

Status	Count	Rate	Implication
Delivered	133	89.3%	Strong fulfilment baseline — maintain or improve
Cancelled	11	7.4%	Investigate root cause: pricing, OOS, or UX friction
Returned	5	3.4%	Low return rate — product quality or description accuracy is good

■ **Fulfilment Insight:** An 89.3% delivery rate is solid for an emerging market e-commerce platform. The 7.4% cancellation rate warrants investigation — common causes in Myanmar e-commerce include out-of-stock situations after order placement, customer price sensitivity, or UX issues at checkout. Reducing cancellations by even 3 percentage points would recover approximately 11M MMK in lost revenue.

7. Data Cleaning Log

Audit trail of all transformations applied to the raw dataset before analysis

The raw dataset (154 rows) contained multiple quality issues before it could be used for analysis. The following table documents every issue found, the number of affected rows, the transformation applied, and the confirmed outcome. All cleaning was performed in Python (Pandas) with reproducible code committed to GitHub.

Issue Type	Rows Affected	Action Taken	Status
Exact duplicate rows	4	Dropped duplicates, kept first occurrence	✓ Fixed
Impossible outlier value (99,999,999 MMK)	1	Recalculated as Unit_Price × Quantity = 45,000	✓ Fixed
Text casing inconsistency (categories & payment)	13	Mapped to canonical title-case values	✓ Fixed
Region abbreviation ("Ygn" → "Yangon")	6	Replaced abbreviation with full name	✓ Fixed
Mixed date formats (DD/MM/YYYY, YYYY.MM.DD)	2	Parsed all dates to standard YYYY-MM-DD	✓ Fixed
Malformed phone numbers (+959, spaces)	2	Stripped spaces, converted to 09xxxxxxx format	✓ Fixed
Missing Total_Amount_MMK	5	Calculated from Unit_Price × Quantity	✓ Fixed
Missing Phone_Number	6	Filled with "Unknown" placeholder	✓ Fixed
Missing Ship_Date	5	Filled with "Unknown" placeholder	✓ Fixed

Metric	Before	After
Total rows	154	150
Duplicate rows	4	0
Missing values (total)	16 cells	0
Invalid outlier values	1	0
Inconsistent categories	13 rows	0
Malformed phone numbers	2	0
Mixed date formats	2	0

8. Key Findings & Recommendations

Data-driven actions for the business based on this analysis

Strategic Recommendations

R1	Replicate the March 2026 Sales Spike March 2026 generated 52.1M MMK — 74.8% higher than February. This spike is the most actionable finding in the dataset. The business should identify what drove March performance (promotion, event, new product launch) and deliberately engineer similar campaigns in Q3 and Q4 2026. Even a partial replication (50% of the March spike) in one additional month would add approximately 9M MMK to annual revenue.
R2	Expand Beyond Yangon — Target Mon State & Shan State Yangon accounts for 54.5% of revenue but likely represents a mature, competitive market. Mon State and Shan State each have 18 orders but disproportionately lower revenue, suggesting lower average cart sizes. Targeted regional promotions, local payment method support, and category-specific campaigns (e.g. Home & Groceries, which suits regional demand) could meaningfully increase revenue from these underserved states without requiring customer acquisition spend.
R3	Invest in TikTok Shop and ShweShop — They Are the Growth Channels While Viber Shop and Website lead in current order volume (45%), TikTok Shop (17.8%) and ShweShop Mobile App (17.5%) represent the highest-growth potential given Myanmar's young, mobile-first demographics. Fashion & Apparel and Cosmetics & Beauty — the top visual categories — are ideally suited to short-form video commerce. A dedicated content strategy for these channels could unlock a new customer segment at low incremental cost.
R4	Investigate and Reduce the 7.4% Cancellation Rate At 11 cancelled orders in 149 total, a 7.4% cancellation rate represents approximately 11.5M MMK in lost potential revenue (at average order value of 1.1M MMK). Common root causes include inventory inaccuracy (orders placed for out-of-stock items), long fulfilment estimates, or checkout friction. A root-cause audit of the 11 cancelled orders — looking at which category, region, channel, and time of day they occurred — would identify the highest-priority fix.

Conclusion: This analysis demonstrates the full data analyst workflow — from raw dirty data through systematic cleaning, exploratory analysis, visualisation, and business recommendation. The Myanmar e-commerce platform shows strong Yangon-centric performance with clear opportunities to grow revenue through regional expansion, channel investment, and replication of seasonal peaks. Next steps include connecting live data sources for

real-time dashboarding and building a customer segmentation model to personalise marketing spend.
